AB A rapid and highly effective method for extg. nucleic acids from cells or virions without using proteolytic enzymes consists of (1) mixing a lysing compn. comprising an org. buffer which maintains the pH at 4-10, a source of a DNA polymerase cofactor, a stabilizer, and .gtoreq.1 compatible nonionic surfactant which will release nucleic acids from cytoplasmic and nuclear membranes of cells or virions; (2) heating the resulting mixt. at or near the b.p. of water for 5-15 min; (3) recovering the nucleic acids for amplification by the polymerase chain reaction (PCR). Human immunodeficiency virus-1 (HIV-1) DNA was extd. from patient blood cells using a lysing compn. contg. Tris buffer (10 mM, pH 8.3), KCl 50, MgCl2 2.5 mM, gelatin 0.1 .mu.g/mL, Nonidet P-40 0.45, and Tween 20 0.45 wt.%. The resulting mixt. was heated at 100.degree. for 10 min and centrifuged .apprx.2 s at 14,000 rpm. Four primers were used in the amplification reaction.

The sequences of antisense nucleic acids which inhibit the proliferation of prokaryotes are disclosed. Cell-based assays which employ the antisense nucleic acids to identify and develop antibiotics are also disclosed. The antisense nucleic acids can also be used to identify proteins required for proliferation, express these proteins or portions thereof, obtain antibodies capable of specifically binding to the expressed proteins, and to use those expressed proteins as a screen to isolate candidate molecules for rational drug discovery programs. The nucleic acids can also be used to screen for homologous nucleic acids that are required for proliferation in cells other than Staphylococcus aureus, Salmonella typhimurium, Klebsiella pneumoniae, and Pseudomonas aeruginosa. The nucleic acids of the present invention can also be used in various assay systems to screen for proliferation required genes in other organisms.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
       The invention describes a method for the isolation of components from
       samples, particularly large molecular weight DNA from biological
       samples. The method involves the application of controlled oscillatory
       mechanical energy to the sample for short periods of time of about 5 to
       60 seconds to lyse the sample and release the component(s) from the
       sample, followed by standard isolation methods. In preferred
       embodiments, the method includes the use of a spherical particle for
       applying the mechanical energy.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

The present invention relates to devices and methods for the collection, storage, and purification of nucleic acids, such as DNA or RNA, from fluid samples for subsequent genetic characterization, primarily by conventional amplification methods. The present invention can be used to collect, store, or purify nucleic acids either from a biological source other than untreated whole blood, the biological source having naturally occurring nucleic acid amplification inhibitors present, (including either a buccal swab, cerebrospinal fluid, feces, lymphatic fluid, a plasma sample, a saliva sample, a serum sample, urine, or a suspension of cells or viruses), or from a treated whole blood source that has naturally occurring nucleic acid amplification inhibitors present, as well as added blood stabilization components that also inhibit nucleic acid amplification. More importantly, these nucleic acids can be released after collection or storage in a manner that enables them to be amplified by conventional techniques such as polymerase chain reaction. In particular, an absorbent material that does not bind nucleic acids irreversibly is impregnated with a chaotropic salt. A biological source sample is contacted with the impregnated absorbent material. Any nucleic acids present in the biological source can be either eluted or resolubilized off the absorbent material.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L7 ANSWER 1 OF 3 USPATFULL

- DETD . . . the components of the liquid medium under sufficient mechanical energy of an oscillatory nature to lyse the tissue components and release nucleic acids.
- DETD . . . involves subjecting the source material to mechanical force and energy that disrupts the cells with violent impact action with consequent release of the nucleic acids.

The **released** DNA or RNA then is recovered, e.g., from a liquid phase of the starting material, such procedure being known in.

- DETD . . . impart impact energy to the beads and these strike the source material cells repeatedly to open the cells so the nucleic acids can be released.
- DETD In dealing with the quest for improving mechanical lysing of tissues for release of cellular components, particularly nucleic acids, it is seen that an apparatus that allows simultaneous separation of plural samples at very high oscillating rate while maintaining. . .
- DETD . . . to a source material of up to about 450 times gravity (.times.g) or more thereby producing relatively complete lysis and release of nucleic acids in a time period that can be as low as from about 3 seconds to about 5 minutes where a.
- DETD . . . acceleration that will produce sufficient mechanical energy in the source material that produces the cell disruption or fracture to allow release of nucleic acids from the organized structures of the cells of the tissue.
- DETD . . . magnitudes as they collide with the cells of nucleic acid source material therein and produce significant cell disruption to allow nucleic acids to release from the cells.
- DETD . . . through the pores during the rupturing process to the extent of the pore diameter. This embodiment facilitates separation of the released suspension, including nucleic acids from insoluble or indestructible materials in the tissue. In this embodiment, the outer container collects the material which passed out.
- DETD . . . to mechanical energy of a particular type as specified herein so as to disrupt tissue and cell structure sufficiently to release nucleic acids, and particularly DNA,
- into the liquid phase for subsequent recovery and purification.

 DETD . . . may be isolated from a disrupted mixture containing an extraction solvent that comprises a neutral buffer and a cocktail of protease inhibitors.
- DETD . . . applied to the tissues, and provides a means for impacting, striking, breaking and/or rupturing the tissue so as to facilitate release of nucleic acids from the tissue and the DNA isolation process.
- DETD . . and also on the particular tissue being treated, with the end objective of selecting a mechanical lysing force sufficient to release nucleic acid without compromising the quality of the recovered product.
- DETD . . . conditions are capable of generating enough mechanical energy by reciprocal motion to break the tissue structure and cell walls and release the nucleic acids.
- DETD The selected detergent may be any of a variety of conventional surfactants including anionic, cationic, non-ionic and amphoteric surfactants.
- DETD D. Protease Solution: 5 mg/ml Proteinase K, 5 mg/ml Pronase in Cell Resuspension Solution with 1% SDS.
- DETD . . . SDS previously added, and the mixture is incubated at 55-65

degrees Centigrade (C) for 10 minutes. Thereafter, 35 ul of Protease Solution is added and thoroughly mixed, and incubated at 55.degree. C. for 10 minutes, inverting occasionally. Thereafter, 450 ul of. . .

CLM What is claimed is:

1. A method of isolating high molecular weight nucleic acid from a biological material which comprises mechanically releasing said high molecular weight nucleic acid from said material by the application of rapidly oscillating reciprocal mechanical energy to said material in the presence of a liquid medium in a closed container to produce a released high molecular weight nucleic acid solution, wherein said released high molecular weight nucleic acid has an average molecular weight greater than 10 kilobases, said liquid medium contains one or more particles and detergent in. . 28. The method of claim 1 wherein said method further comprises the step of isolating said nucleic acid from said released nucleic acid solution.

· L7 ANSWER 2 OF 3 USPATFULL

AΒ . . . acid amplification inhibitors present, as well as added blood stabilization components that also inhibit nucleic acid amplification. More importantly, these nucleic acids can be released after collection or storage in a manner that enables them to be amplified by conventional techniques such as polymerase

. . acid amplification inhibitors present, as well as added blood SUMM stabilization components that also inhibit nucleic acid amplification. More importantly, these nucleic acids can be released after collection or storage in a manner that enables them to be amplified by conventional techniques such as polymerase

. . . fluids when one desires to analyze any nucleic acids present in SITMM the biological source. One would have to use a protease digestion, organic extraction, and/or an ion exchange step in order to retrieve nucleic acids.

SUMM . . . used to detect pathogens such as bacteria or viruses that can be found in the circulatory system. More importantly, these nucleic acids can be released after collection or storage in a manner that enables them to be amplified by conventional techniques such as polymerase chain reaction. The release of amplifiable nucleic acids is substantially more than in the presence of the inhibitory composition alone. In particular, an absorbent material that does not. .

SUMM . . . damage either nucleic acid templates, (such as RNAses, DNAses), or damage PCR polymerases used in the amplification reactions, (such as proteases). These substances can be found in buccal swabs, cerebrospinal fluids, feces, lymphatic fluids, plasma, saliva, serum, sputum, or urine. In. .

DETD . . . order to enhance lysis or disruption of intact cells, bacteria or viruses absorbed onto the device. For example, suitable anionic, cationic, or zwitterionic surfactants, such as Tween 20 or Triton X-100, can be impregnated into the absorbent material along with the chaotropic salt. Suitable. CLM What is claimed is:

. comprising an absorbent material that does not bind irreversibly to nucleic acids, a chaotropic salt impregnated about the absorbent material, nucleic acids from the biological source releasably bound to the absorbent in an amplifiable form, the amplification inhibitors being bound to the adsorbent such that resolubilization does not occur by releasing the nucleic acids from the adsorbent.

. and the amplification inhibitors from the biological source being bound to the adsorbent such that resolubilization does not occur by releasing the nucleic acids from the adsorbent.

L7 ANSWER 3 OF 3 USPATFULL

AB . . . acid amplification inhibitors present, as well as added blood stabilization components that also inhibit nucleic acid amplification. More importantly, these nucleic acids can be released after collection or storage in a manner that enables them to be amplified by conventional techniques such as polymerase chain. . .

SUMM . . . acid amplification inhibitors present, as well as added blood stabilization components that also inhibit nucleic acid amplification. More importantly, these nucleic acids can be released after collection or storage in a manner that enables them to be amplified by conventional techniques such as polymerase chain.

SUMM . . . fluids when one desires to analyze any nucleic acids present in the biological source. One would have to use a **protease** digestion, organic extraction, and/or an ion exchange step in order to retrieve nucleic acids.

SUMM . . . used to detect pathogens such as bacteria or viruses that can be found in the circulatory system. More importantly, these nucleic acids can be released after collection or storage in a manner that enables them to be amplified by conventional techniques such as polymerase chain reaction. The release of amplifiable nucleic acids is substantially more than in the presence of the inhibitory composition alone. In particular, an absorbent material that does not. . .

SUMM . . . damage either nucleic acid templates, (such as RNAses, DNAses), or damage PCR polymerases used in the amplification reactions, (such as proteases). These substances can be found in buccal swabs, cerebrospinal fluids, feces, lymphatic fluids, plasma, saliva, serum, sputum, or urine. In. . .

DETD . . . order to enhance lysis or disruption of intact cells, bacteria or viruses absorbed onto the device. For example, suitable anionic, cationic, or zwitterionic surfactants, such as Tween 20 or Triton X-100, can be impregnated into the absorbent material along with the chaotropic salt. Suitable. . .

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
       The invention relates to compositions and methods for rapidly detecting
       or isolating a target nucleic acid sequence in a polynucleotide-
       containing sample. The sample is exposed to a rapid pairing reagent,
      which contains a rapid capture component, effective to rapidly and
      non-selectively bind polynucleotides, and a target specific probe,
       effective to selectively bind the target nucleic acid sequence.
       Selectively disrupting the binding between the capture component and
      polynucleotides leaves only target sequence bound to the rapid pairing
      reagent.

This invention relates to safe and effective methods for the extraction of nucleic acids. In particular, methods are described for isolating nucleic acid from a sample containing a biological mixture of nucleic acids and other biological compounds wherein the sample is combined with an extraction solution containing at least one organic compound such as benzyl alcohol or a benzyl alcohol derivative to form an aqueous and non-aqueous phase. The nucleic acid is isolated from the aqueous phase. Preferably, the resulting combined solution also contains bentonite, as defined below. Typically, the sample will first be combined with a lysing agent before extraction. The lysing agents preferred are chaotropic salts such as guanidinium hydrochloride and guanidinium isothiocyanate. ANSWER 1 OF 4 USPATFULL

. . . only solubilizes the plasma membrane (e.g., hypotonic nonidet SUMM P-40 lysis buffer). The latter reagents also require addition of a nuclease inhibitor. Organic solvent extraction or silica membrane absorption methods are then be used to extract the RNA from the cell lysate..

Ribonuclease A is subject to cold-denaturation at elevated DETD pressures. Addition of a reducing agent can subsequently facilitate irreversible denaturation by reducing.

DETD After treatment, each sample was centrifuged at 10,000 rpm for 10 minutes to separate released nucleic acids from cell debris and intact cells. Both the supernatant and the pellet were treated with proteinase K and analyzed by.

T-2 ANSWER 2 OF 4 USPATFULL

. . . polyamine may be used as a reporter group, as described below. DETD In this case, the weakly basic amine component should release nucleic acids at a pH where strongly-basic amines still effectively bind nucleic acids, typically about pH 9 to 10.

DETD Generally, before utilizing the method of the invention, a specimen must be treated in order to release nucleic acids

from biological structures. This can be accomplished by a variety of methods known in the art. Preferably, the cellular, subcellular,. .

. . . mM MnCl.sub.2, 150 mM NaCl, 0.5 mM Atp, 50 .mu.g/ml acetylated DETD bovine serum albumin, 2 mM dithiothreitol, 60 Units recombinant ribonuclease inhibitor (rRNasin, Promega Biotech, Madison, Wis.), approximately 37.5 .mu.g of radiolabelled RNA transcript (prepared as above), and 30 Units poly A. .

ANSWER 3 OF 4 USPATFULL

SUMM . . . as phenol or phenol/chloroform. Chirgwin et al., Biochemistry 18:5294-5299 (1979) described the isolation of intact RNA from tissues enriched in ribonuclease by homogenization in guanidinium thiocyanate and 2-mercaptoethanol, followed by ethanol precipitation or by sedimentation through cesium chloride.

Further, the use of chaotropic agents such as guanidinium thiocyanate SUMM (GnSCN) are widely used to lyse and release nucleic acid from cells into solution, largely due to the fact that chaotropic salts inhibit nucleases and proteases. However, it has

SUMM the starting material is complex, such as feces or blood. In 1959, Brownhill et al. reported that bentonite was an inhibitor of nucleases (Brownhill et al., Biochem. J. 73:434 (1959)). Fraenkel-Conrat et al. later developed a procedure for the use of bentonite to inhibit ribonuclease in a procedure to purify tobacco mosaic virus (Fraenkel-Conrat et al., Virology 14:54-58 (1961)). Subsequent researchers reported the use of bentonite in combination with phenol and chloroform in the reduction of ribonuclease activity during the isolation of RNA (Jacoli et al., Can. J. Biochem. 51:1558-1565 (1973); Griffin et al., Anal. Biochem. 87:506-520. .

Also preferably resident in the extraction solution is a nuclease DETD inhibitor, preferably an organoclay or the like, and more preferably bentonite, Macaloid.RTM., Bentone.RTM. (a bentonite or hectorite organoclay platelet having a. . . for extended periods of time, as compared to bentonite and Macaloid.RTM.. It may be necessary to first purify the nuclease inhibitor, for instance bentonite or Macaloid.RTM., as described in Sambrook et al., Molecular Cloning--A Laboratory Manual, Cold Spring Harbor Laboratory, Cold. . . small uniform particles be used. Such nuclease inhibitors are particularly desirable when extraction of RNA is desired. In samples where ribonuclease does not substantially hinder extraction, or if DNA only is being extracted, nucleic acid may be extracted without the use.

DETD . . No. 0 127 327, which is incorporated by reference herein. The chaotropic agent is present at a concentration sufficient to release nucleic acid from target cells and to protect the released nucleic acid from nucleases. Typically, the chaotrope is present at a concentration from about 1 M to about 5 M, and more. . .

CLM What is claimed is:

1. An extraction composition for the isolation of released nucleic acids comprising: at least one organic compound which is a liquid at room temperature and which is selected from the group. . .

13. An extraction composition for the isolation of **released nucleic acids** comprising: a clay or a silicate or an admixture of said clay and said silicate; and at least one organic. .

L2 ANSWER 4 OF 4 USPATFULL

SUMM . . . as phenol or phenol/chloroform. Chirgwin et al., Biochemistry 18:5294-5299 (1979) described the isolation of intact RNA from tissues enriched in ribonuclease by homogenization in guanidinium thiocyanate and 2-mercaptoethanol, followed by ethanol precipitation or by sedimentation through cesium chloride.

SUMM Further, the use of chaotropic agents such as guanidinium thiocyanate (GnSCN) are widely used to lyse and release nucleic acid from cells into solution, largely due to the fact that chaotropic salts inhibit nucleases and proteases. However, it has proved. . .

SUMM . . . the starting material is complex, such as feces or blood. In 1959, Brownhill et al. reported that bentonite was an inhibitor of nucleases (Brownhill et al., Biochem. J. 73:434 (1959)).

Fraenkel-Conrat et al. later developed a procedure for the use of bentonite to inhibit ribonuclease in a procedure to purify tobacco mosaic virus (Fraenkel-Conrat et al., Virology 14:54-58 (1961)). Subsequent researchers reported the use of bentonite in combination with phenol and chloroform in the reduction of ribonuclease activity during the isolation of RNA (Jacoli et al., Can. J.
